- 3 Ablation Study of Siamese Margin

Rethinking the Architecture of Siamese Tracking

➤ Summarizing Siamese tracking networks pipeline

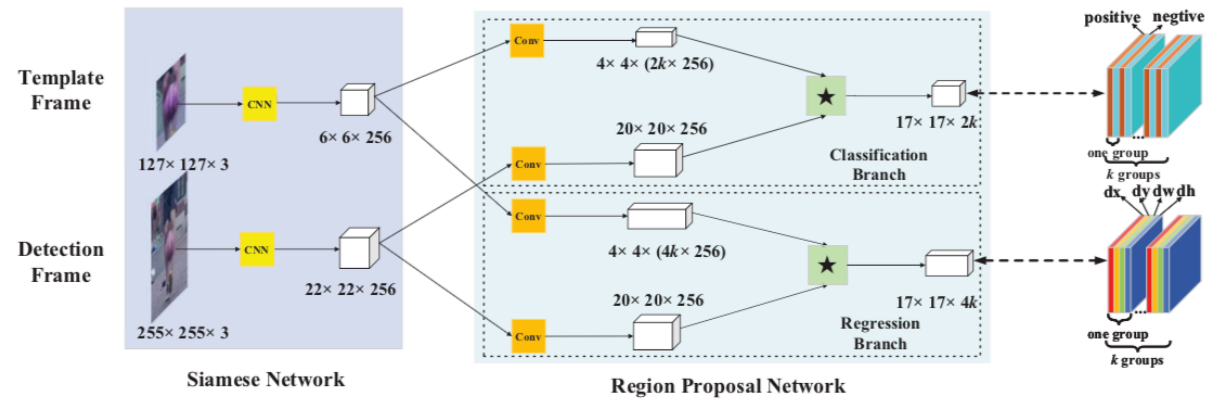

Rethinking the Architecture of Siamese Tracking

➤ Siamese networks for tracking

1. SiamFC [1]

2. SiamRPN [2]

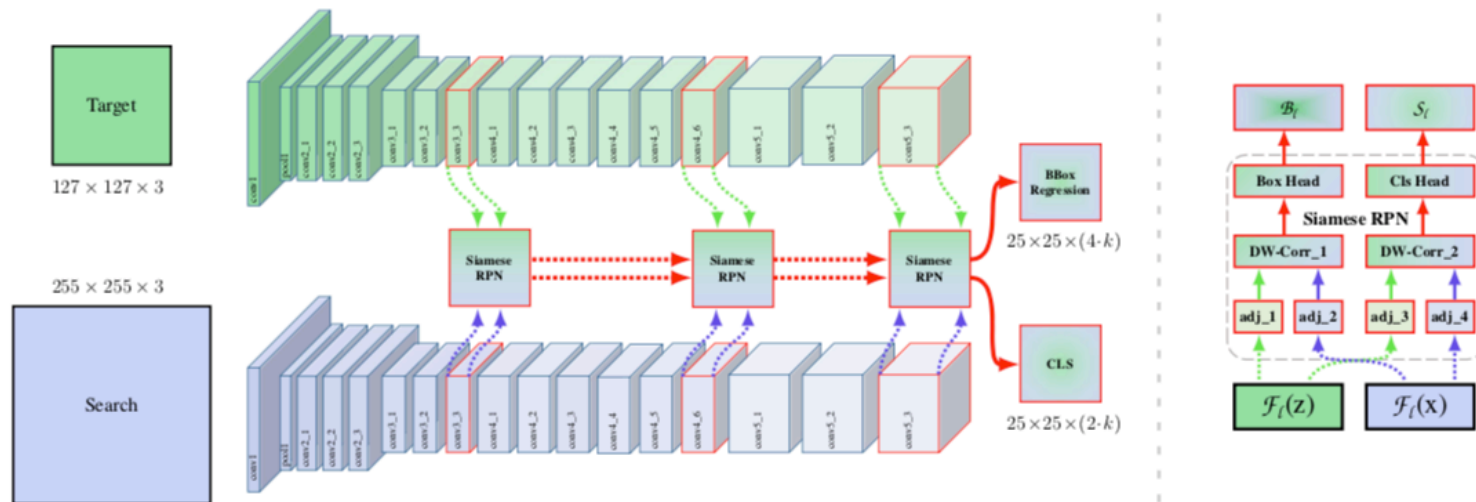

[1] L. Bertinetto, J. Valmadre, J. F. Henriques, A. Vedaldi, and P. H. Torr. Fully-convolutional siamese networks for object tracking. In *European conference on computer vision*, pages 850–865. Springer, 2016

[2] B. Li, J. Yan, W. Wu, Z. Zhu, and X. Hu. High performance visual tracking with siamese region proposal network. In *Proceedings of the IEEE Conference on Computer Vision and Pattern Recognition*, pages 8971–8980, 2018.

Rethinking the Architecture of Siamese Tracking

➤ Siamese networks for tracking

3. SiamRPN++ [3]

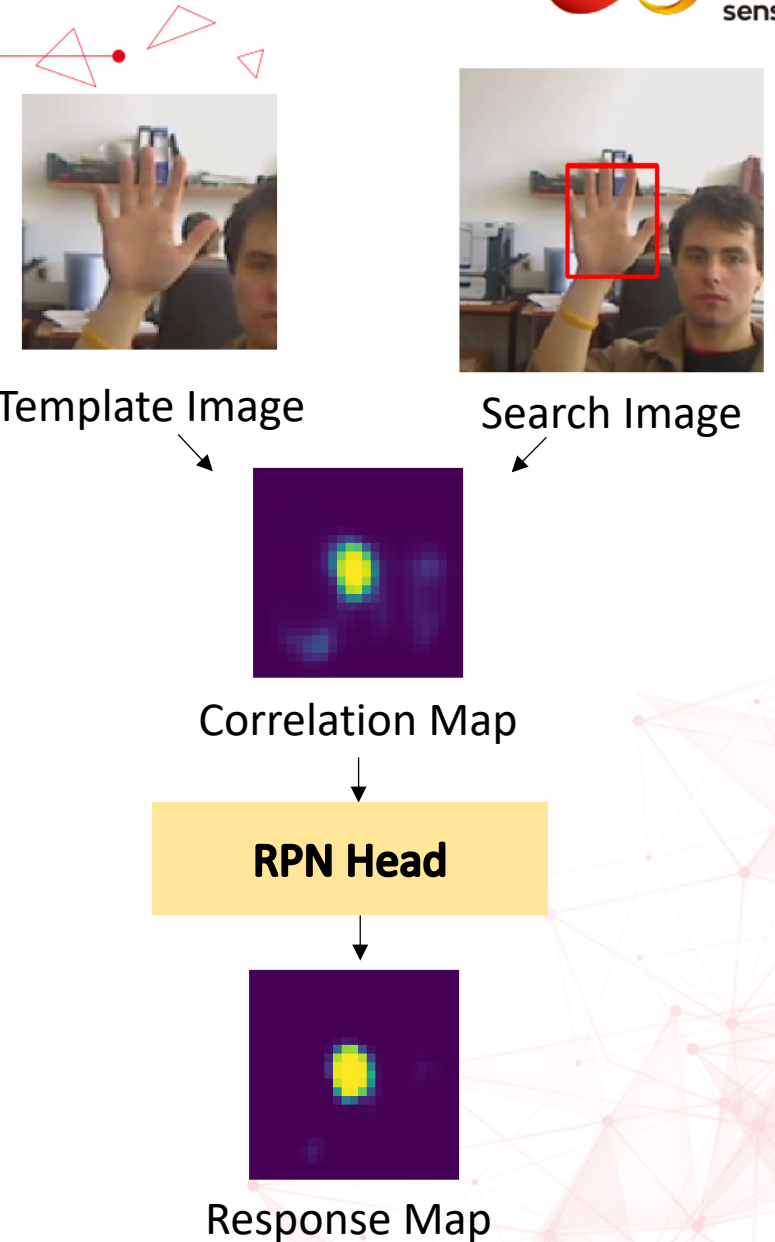

[3] B. Li, W. Wu, Q. Wang, F. Zhang, J. Xing, and J. Yan. Siamrpn++: Evolution of siamese visual tracking with very deep networks. *arXiv preprint arXiv:1812.11703*, 2018.

Rethinking the Architecture of Siamese Tracking

➤ The importance of Feature & Correlation map

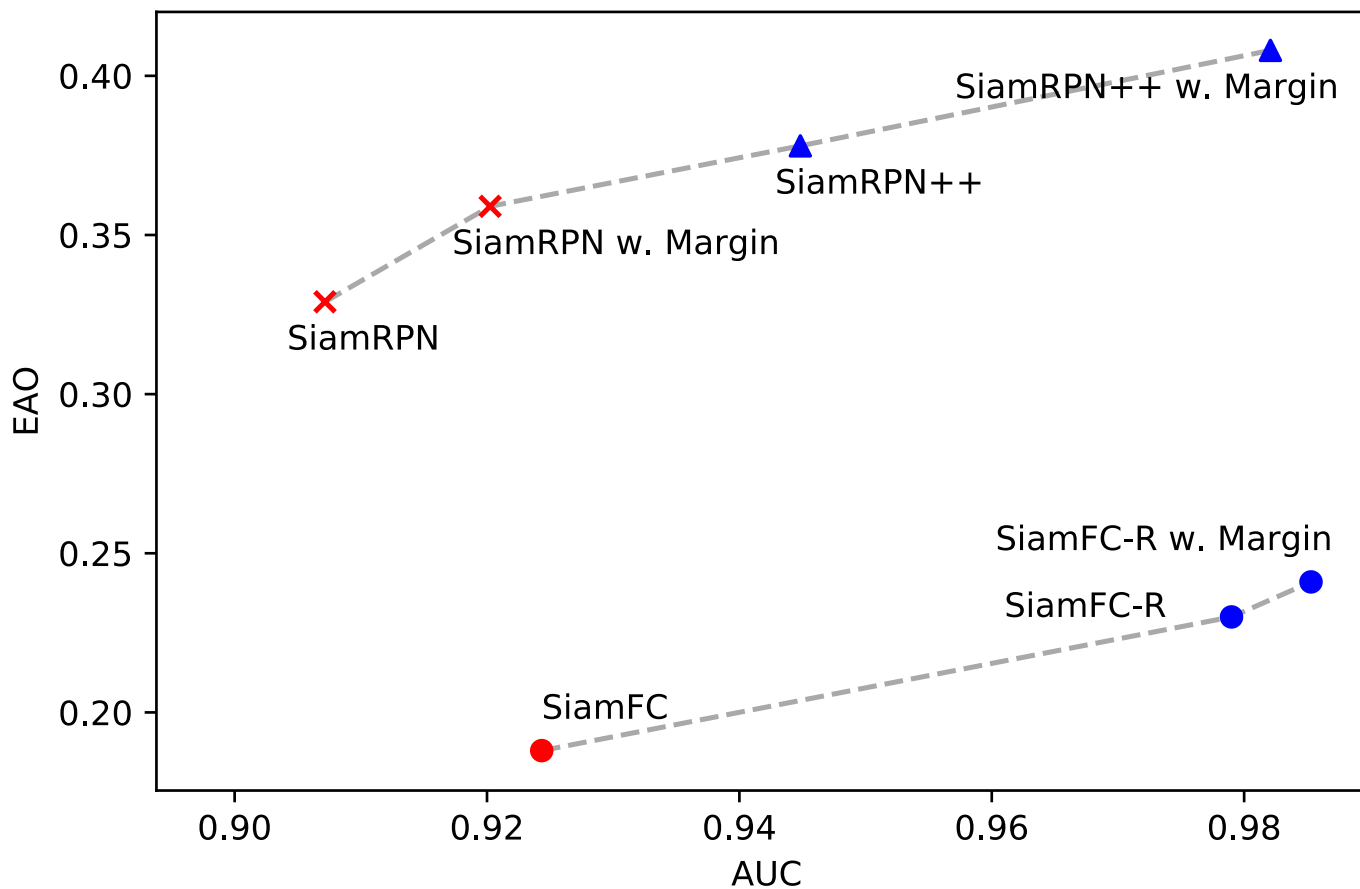

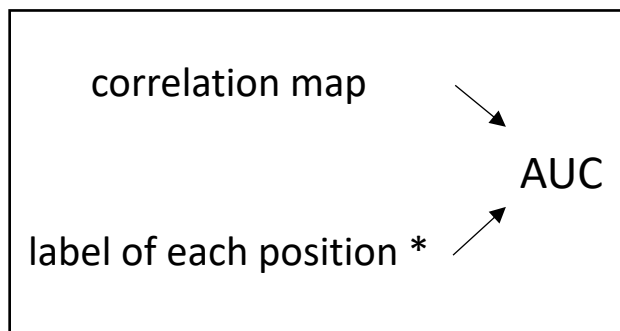

- Correlation map: **similarity** between template and search local features
- Ideal correlation map : Response peak at target location
-- that's just how SiamFC[1] works.
- Region Proposal Networks (RPN) head can be viewed as a **refinement** network
- Therefore, RPN head performs better if correlation map is better. (more clear)

Rethinking the Architecture of Siamese Tracking

➤ The importance of Feature & Correlation map

Good Feature -> Good correlation map -> Good Performance

*We follow the label definition of SiamFC[1] for AUC evaluation

➤ The distortion of Correlation map

(a) Template image

(b) Search image

(c) **Distorted** correlation map
of SiamRPN++

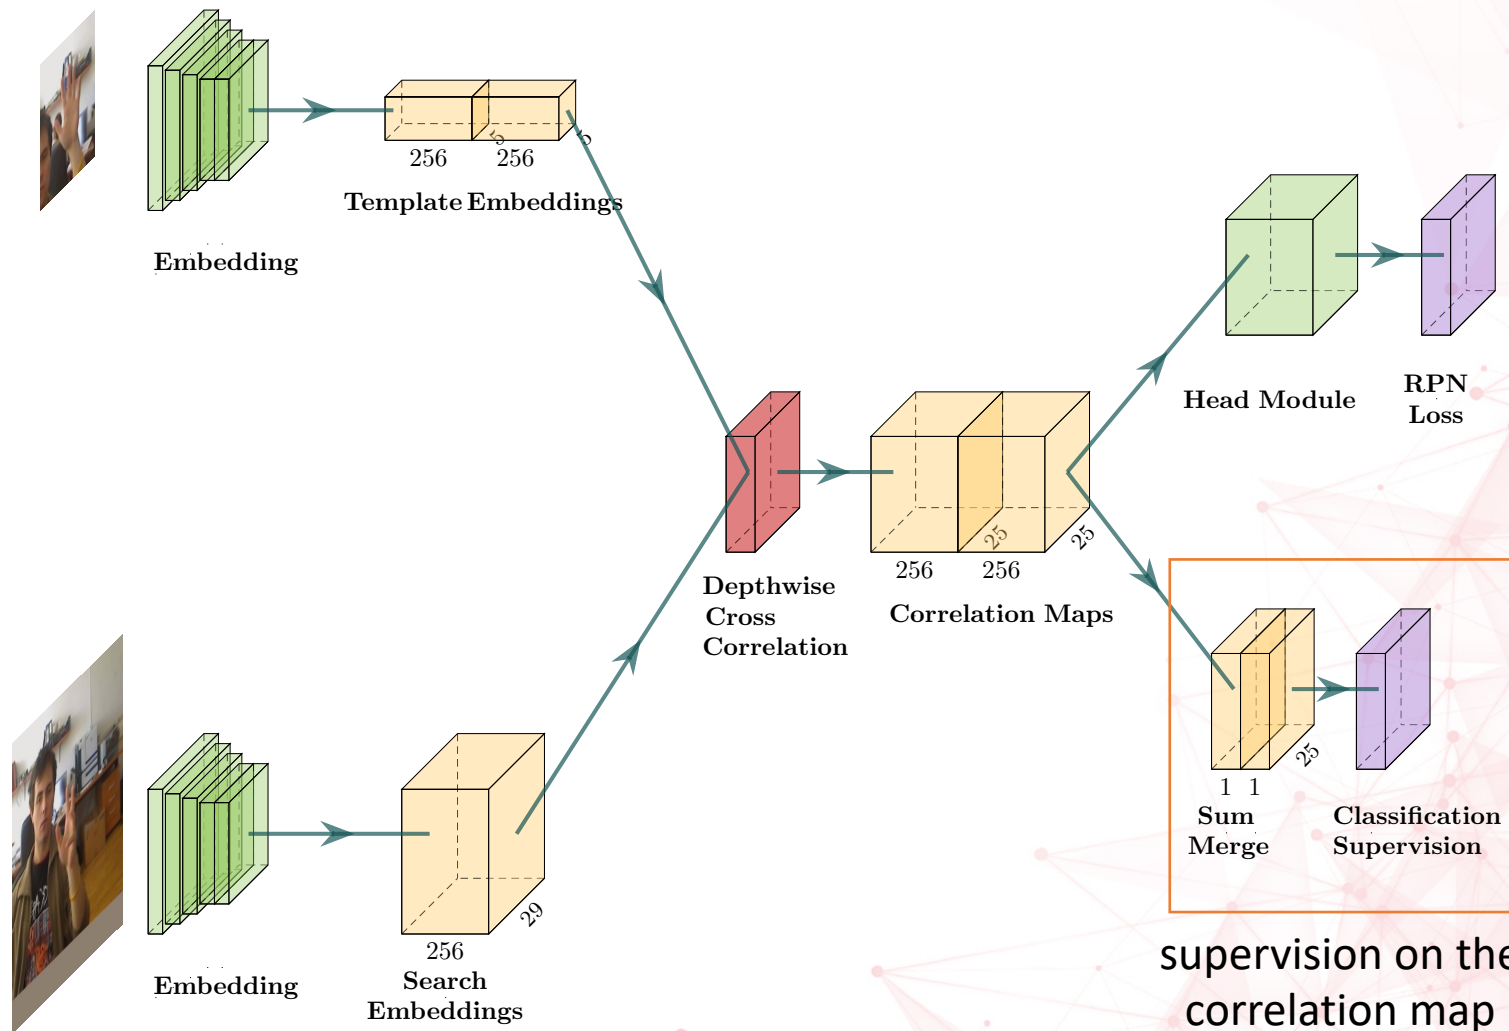

(d) RPN output of
SiamRPN++

- The **distortion** of correlation map in SiamRPN++! (figure (c))
- Reason: RPN head can't guarantee monotonically increasing of correlation similarity !

Learning Discriminative Feature Embeddings for Object Tracking

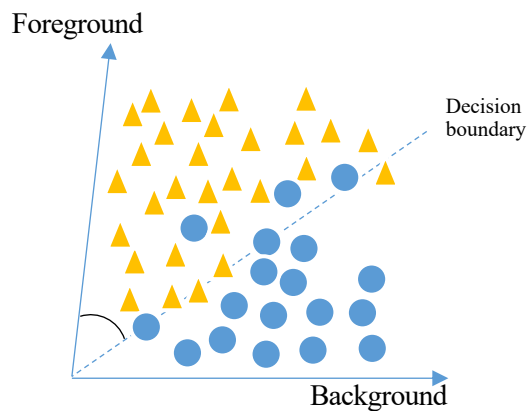

➤ How to get ideal correlation map
naïve way : impose supervision on the correlation map

- Conduct a binary classification supervision on the correlation map
- Label: shared from RPN
'1' for any anchor in the position is positive;
'0' for none of anchors in the position is positive.

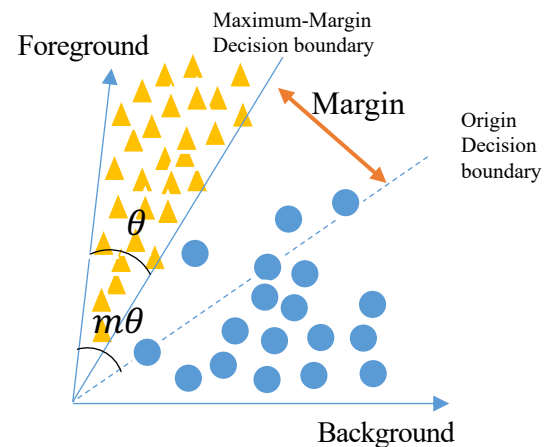

➤ Going further : SiamMargin

Harsh supervision : **Large margin classification loss**

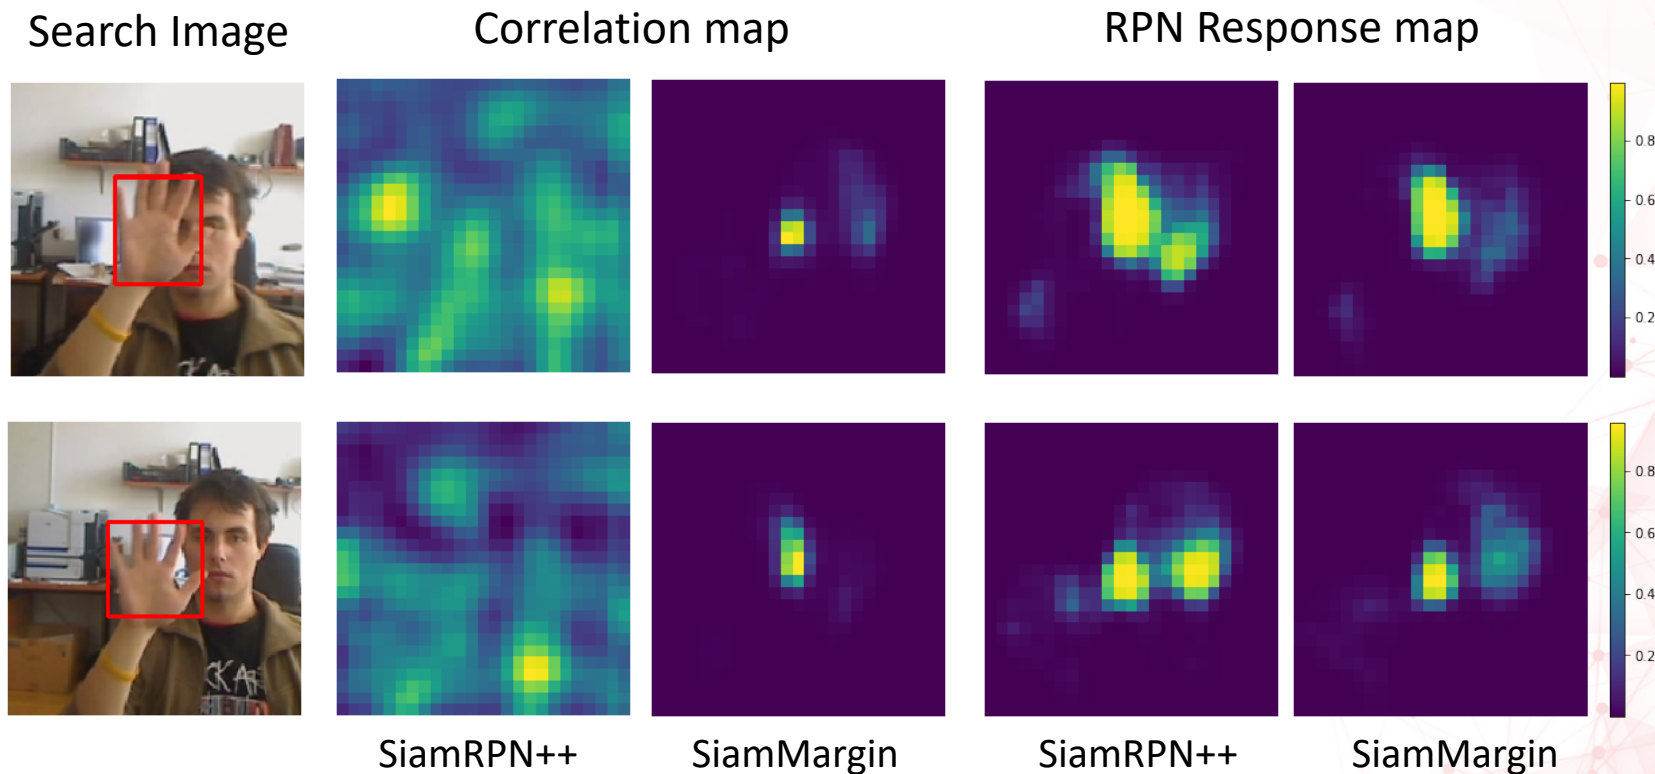

Regular Embedding

Discriminative Embedding

➤ Correlation map visualization

- Semantically similar: e.g. 'FACE' and 'HAND' in the Search Image.
- Our SiamMargin model can suppress the response of hard negative samples while maintain true target response.

Learning Discriminative Feature Embeddings for Object Tracking

➤ The RPN response distribution becomes more separable

target
background

logits distribution of RPN classification response

Without supervision

Regular supervision

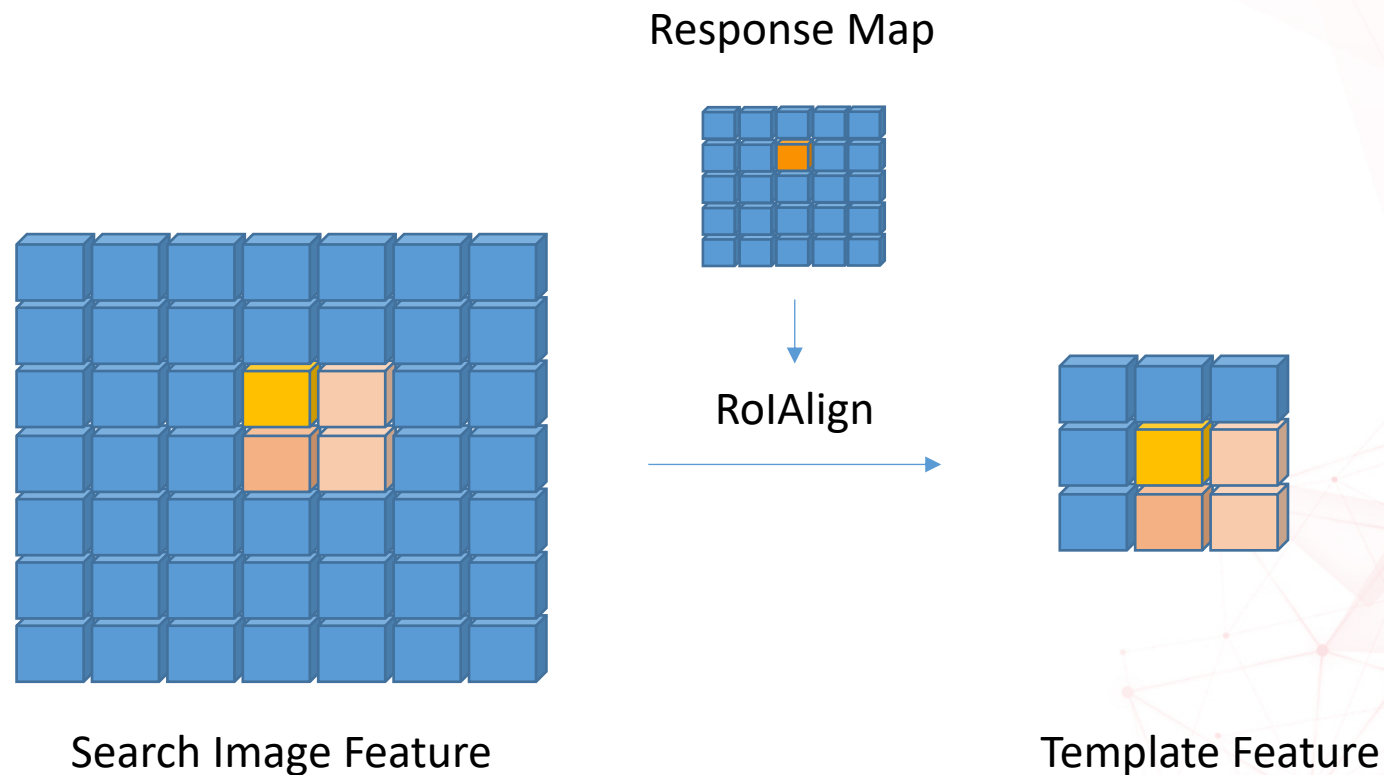

Large Margin supervision

RPN Response

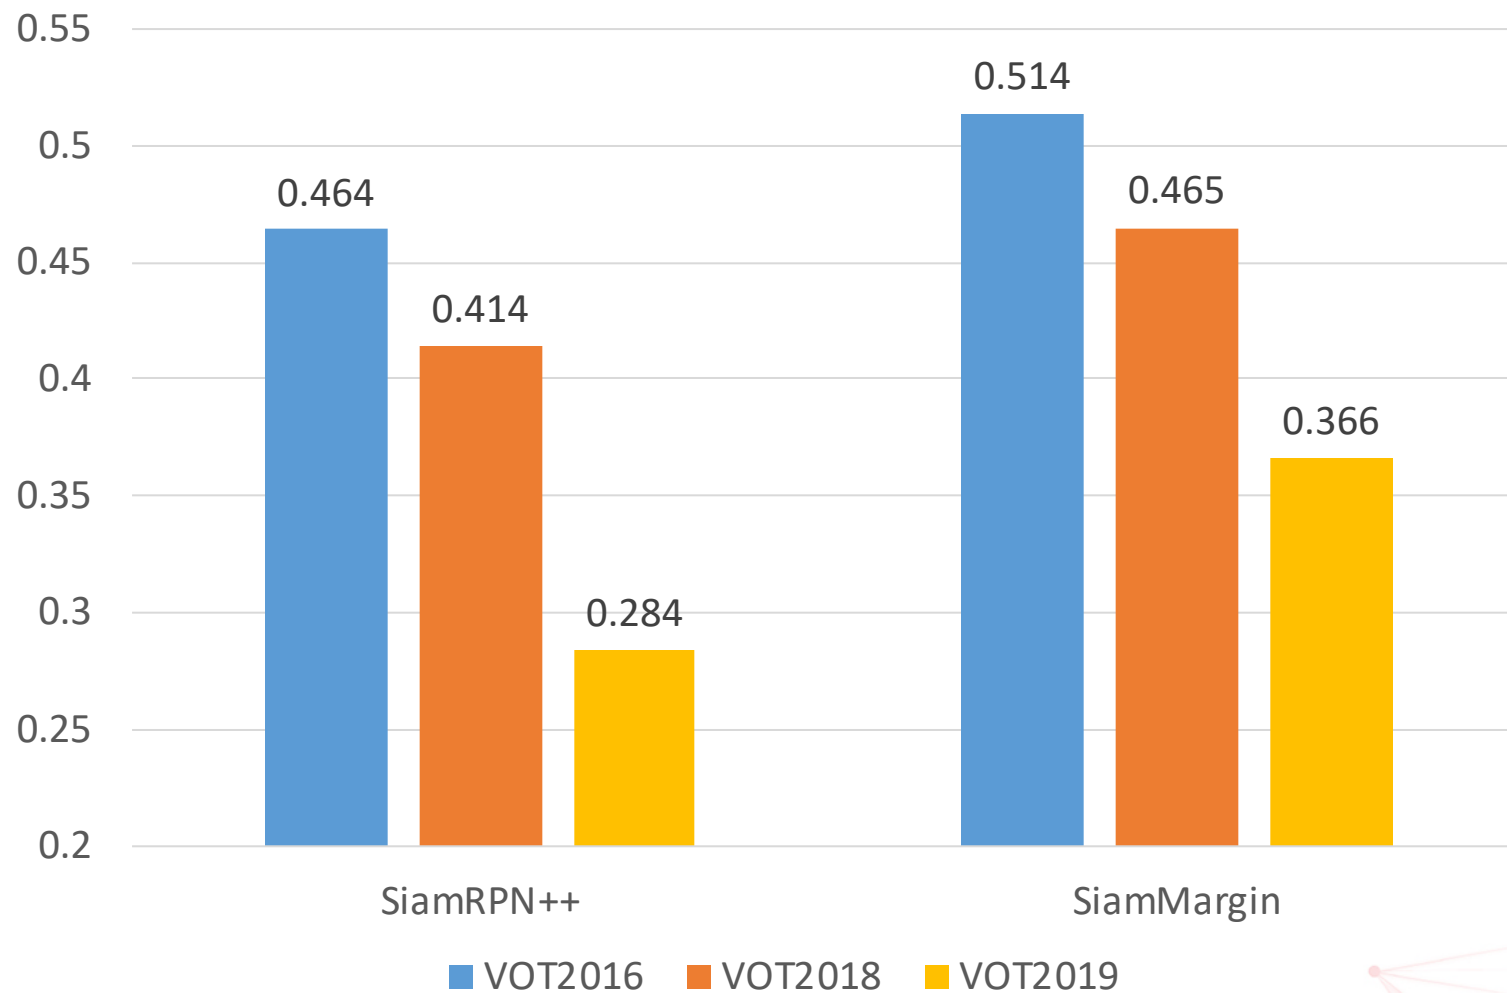

➤ Adaptive Online Update in Siamese Networks

- Previous Siamese networks lack of capacity to handle appearance change (lack of update)
- Discriminative embedding is crucial for reducing noise caused by template update
- Updating with a simple yet efficient moving average strategy
- Nearly cost free: only **1.86%** extra time cost!

Ablation Study of Siamese Margin

➤ SOTA Performance on the Several Benchmarks

Ablation Study of Siamese Margin

➤ Results on VOT2019-RT

Large Margin	Online update (ROI-Align)	One more search	Adaptive Search Region	Accuracy	Failure	EAO
-	-	-	-	0.585	91.3	0.287
-	-	Y	Y	0.587	87.3	0.297
Y	-	Y	Y	0.595	69.0	0.325
Y	Y	Y	Y	0.578	65.0	0.366

More Robust!

Failure from 91.3 times -> **65.0** times
28.8% relative improvement !

Ablation Study of Siamese Margin

➤ Video Demo

EAO	Accuracy	Failures	FPS
0.366	0.578	65.0	45.618
